

A Pro-Flow drainage system integrates the reliable baseboard system with the tried and true sub-floor tile system.

Pro-Flow is specially designed for installation on top of the footing under the floor. The large design in the Pro-Flow arch is an improvement, providing sheer strength and support for your floor over it. This design provides an in-floor channel and gives Pro-

Flow the volume necessary to collect, control and drain water to the sump-pump unit.

Pro-Flow is an advanced design with the strength and capability of handling large volumes of water. It provides you with the best system available, keeping your basement floor dry.

SUN DRY WATERPROOFING
